

CineStream Content Analytics Dashboard

Module 7 Report

Introduction

This report summarizes key business insights obtained from the CineStream Streamlit dashboard. The dashboard allows users to filter the catalog and analyze performance using KPIs and interactive visualizations.

1. Genres and Languages

The dashboard compares views, watch hours, and average audience completion by genre and language. Genres and languages with the highest total views and watch hours represent the strongest audience demand, while categories with consistently low values are underperforming and may require reduced investment or improved promotion.

2. Budget vs ROI

The Production Cost vs Revenue scatter plot and ROI by Genre chart show whether expensive productions recover their investment. Several high-budget titles generate strong profits, but many smaller productions deliver higher ROI percentages, indicating that efficient spending often provides better returns than large budgets.

3. Content Mix Over Time

The monthly trend and content-type charts show how Movies, Series, Documentaries, and Stand-up specials change over time. This helps management identify whether the platform is investing more heavily in particular content types each year and understand shifts in audience preferences.

4. Countries and Subscribers

By grouping data by Country and SubscribersGainedThousands, the dashboard identifies countries that generate the highest number of subscribers per title. These markets should receive higher investment in licensing, production, and marketing because they contribute the greatest audience growth.

5. IMDb Score vs Popularity

The IMDb histogram and IMDb vs Views scatter plot indicate that higher ratings do not always produce higher view counts. Some critically acclaimed titles receive moderate audience attention, while some highly viewed titles have average ratings. Popularity and critical acclaim are related but not identical.

6. Loss-Making Titles

Titles where Production Cost exceeds Revenue are identified using Profit_Cr and ROI_Pct. Common characteristics may include specific genres, languages, longer runtimes, or restrictive age ratings. These insights help management reduce future financial risk and improve content planning.

Conclusion

The CineStream dashboard converts raw catalog data into actionable business insights. It supports decisions related to content acquisition, budgeting, marketing, and quality monitoring through interactive filtering and visualization.
